## 2014 Pennsylvania Corn Club

This was another in a string of record years for the producers in the 5 Acre Corn Club. This year, yields averaged over 250 bushels per acre, up from 237 last year. Corn yields have been increasing for club members at just about 4 bushels per acre/ year for the past twenty years, which is about twice the state average. Conditions were great for corn production this year with little moisture stress during the entire season. Planting was delayed a bit in some areas and there were few days with temperatures in the 90s. These factors may have limited heat units and yields for some participants in central and western PA. Our analysis of cultural practices shows that plant populations continue to increase, now averaging about 31,500, up about 500 from last year. Club members seem to confirm what many of us think are keys to high yield in our state: crop rotation, sidedressing and use of manure. About 70% of participants sidedressed this year an average of about 110 pounds of N per acre. An increasing number of club members have used fungicides, up to about 20% this year.

Congratulations to all the producers who participated in this year's program. Many thanks are due to the extension educators and crop consultants who help collect the yield and cultural information for the club. Also, a special thanks is due to Austin Kirt and Mark Antle in the Department of Plant Science for their diligent work in pulling this report together.

Greg W. Roth, Department of Plant Science, Penn State
